Etalonnage et masses exactes - Exploitation*

Frédéric Aubriet

frederic.aubriet@univ-lorraine.fr

Outlook

How to obtain a mass spectrum as representative as possible of the studied sample?

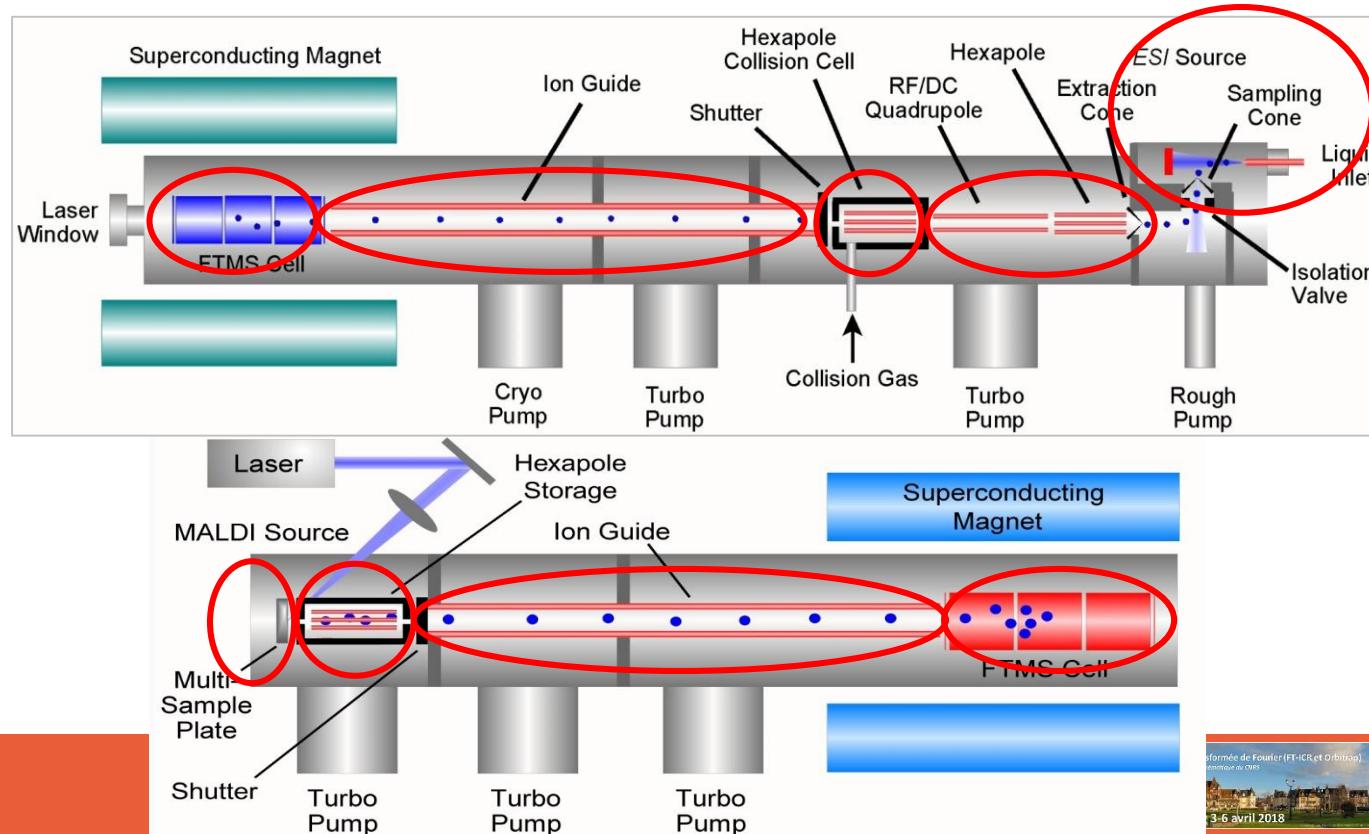

How to obtain a mass spectrum with a good mass measurement accuracy (recalibration methods)?

Assignment of the obtained features: from manual to automatized assignment

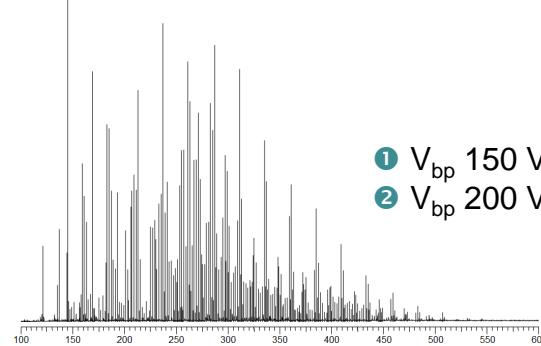

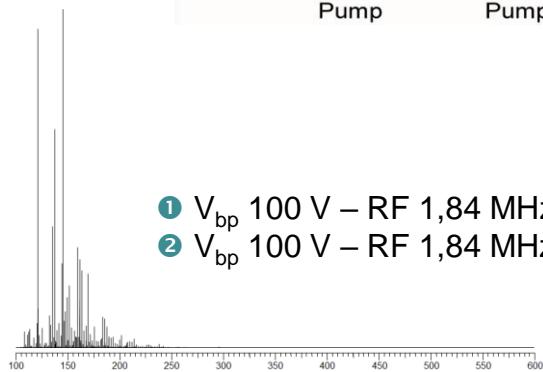

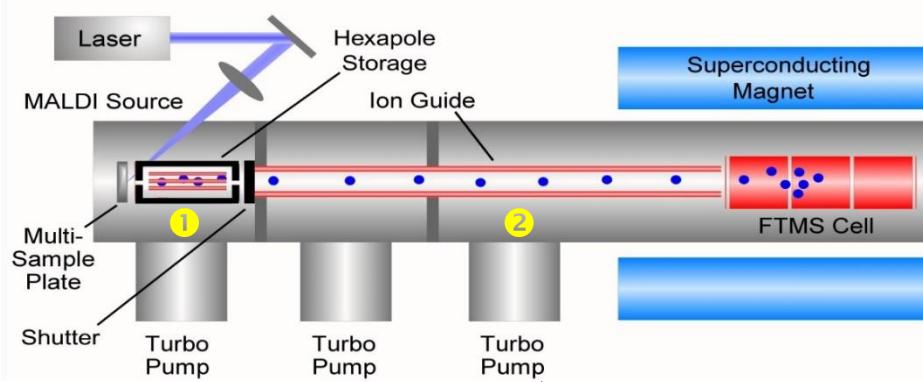

How to efficiently visualize the data?

Some examples

To obtain representative features may a an issue with external ion source

Discrimination coming from the ion transfer

The accuracy m/z measurement

The fundamental equation in FT-ICR MS

- The m/z ratio is calculated from the cyclotronic frequency
 - In the simplest case, only the value of the magnetic field is considered:

$$\omega_c = z \cdot e \cdot B_0 / m$$

- A more accurate equation takes into account the reduction of ω_c relative to the application of the trapping electric field:

$$\omega_o = \omega_c - 2\alpha V_T / a^2 B_0$$

α Parameter depend of the ICR cell geometry

V_T Trapping voltage

A Distance between the trapping plates

The accuracy m/z measurement

Space charge effects (FT-ICR MS)

- Space charge effects come from the electric fields generated by the ions themselves in the ICR cell:
 - 10^6 ions in the cell lead to the “decrease” of the trapping voltage by 0.05V.
 - A more global equation has to consider the effect of the magnetic field, the trapping potential and the space charges:

$$\omega_o = \omega_c - 2\alpha V_T/a^2 B_0 - q\rho G_i/\epsilon_o B_0$$

q Charge

ρ Charge density

G_i Geometric parameter linked to the shape of the ion clouds

Masselon, Tolmachev, Anderson, Harkewicz, Smith *JASMS* 2002; 13: 99-106.

The accuracy m/z measurement

Calibration of FT-ICR MS

- For an optimum m/z measurement accuracy, the trapping voltage, the magnetic field, the number of ions have to be as constant as possible (the charge density ρ has to be as low as possible: highly diluted case or total ion current has to be taken into account).

$$\omega_o = \omega_c - \frac{2\alpha V_T / a^2 B_0 - q\rho G_i / \epsilon_0 B_0}{qB_0/m \equiv A/(m/z)}$$

Constant

$2\pi f$ $qB_0/m \equiv A/(m/z)$ B

- Finally

$$f = K_1/(m/z) + K_2$$

Calibration and recalibration – FT-ICR MS

- Diluted medium

$$f = \frac{K_1}{m/z} + K_2$$

$$m/z = \frac{K_1}{f - K_2}$$

$$m/z = \frac{A}{f} + \frac{B}{f^2}$$

- Correction of the charge density for the i ions

$$f = \frac{K_1}{m/z} + K_2 + K_3 I_i$$

$$m/z = \frac{K_1}{f - K_2 - K_3 I_i}$$

$$m/z = \frac{A}{f} + \frac{B + CI_i}{f^2}$$

- For average mass spectrum additional correction to take into account the variation of the total ion current

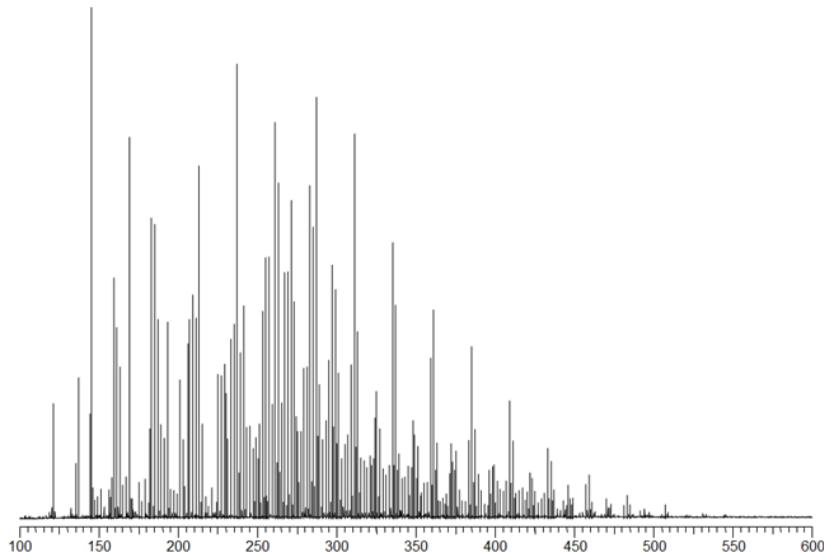

$$f = \frac{K_1}{m/z} + K_2 + K_3 I_i + K_4 I_{tot}$$

$$m/z = \frac{K_1}{f - K_2 - K_3 I_i - K_4 I_{tot}}$$

$$m/z = \frac{A}{f} + \frac{B + CI_i + DI_{tot}}{f^2}$$

Calibration and recalibration – FT-ICR MS

Results

$$m/z = \frac{A}{f} + \frac{B}{f^2}$$

$$m/z = \frac{A}{f} + \frac{B + CI_i}{f^2}$$

Average	0,72 ppm	0,69 ppm
P ₂₅	0,34 ppm	0,33 ppm
P ₅₀	0,65 ppm	0,62 ppm
P ₇₅	1,02 ppm	0,98 ppm
Σ _{error}	0,015 ppm	0,008 ppm

The accuracy m/z measurement – Calibration

Equation de Calibration en Orbitrap

- Highly diluted medium (simplest equation)

$$m/z = \frac{B}{f^2}$$

- Space charge effect created by an amount of Q charges

$$m/z = \frac{B(Q)}{f^2}$$

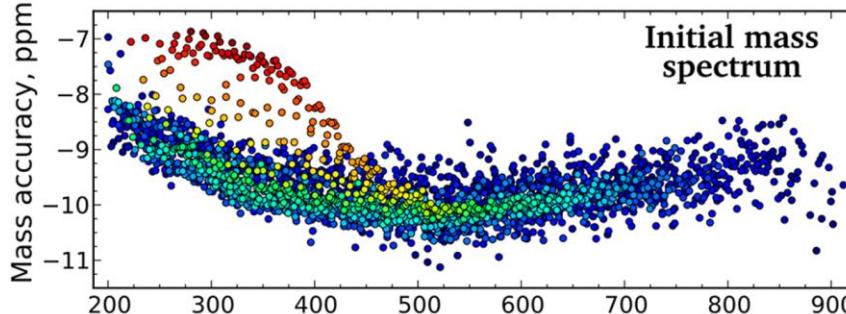

- To refine the consideration of the space charge effect an additional parameter may be used

$$m/z = \frac{B(Q)}{f^2} + \frac{C(Q)}{f^3}$$

Kozhinov, Zhurov, Tsybin *Anal Chem* 2013; 85: 6037-6445.

The accuracy m/z measurement – Orbitrap

Exemple

- The error is depending on the m/z ratio and the ion abundance
- How to proceed
 - Define internal calibrant ions
 - Determine the ε error function for these calibrants
 - Increase the m/z measurement accuracy by minimization of the ε_j

Kozhinov, Zhurov, Tsybin *Anal Chem* 2013; 85: 6037-6445.

The accuracy m/z measurement – Recalibration

- For n calibrant ions, the minimization of ε_j leads to the error function which weights each error by ω_j

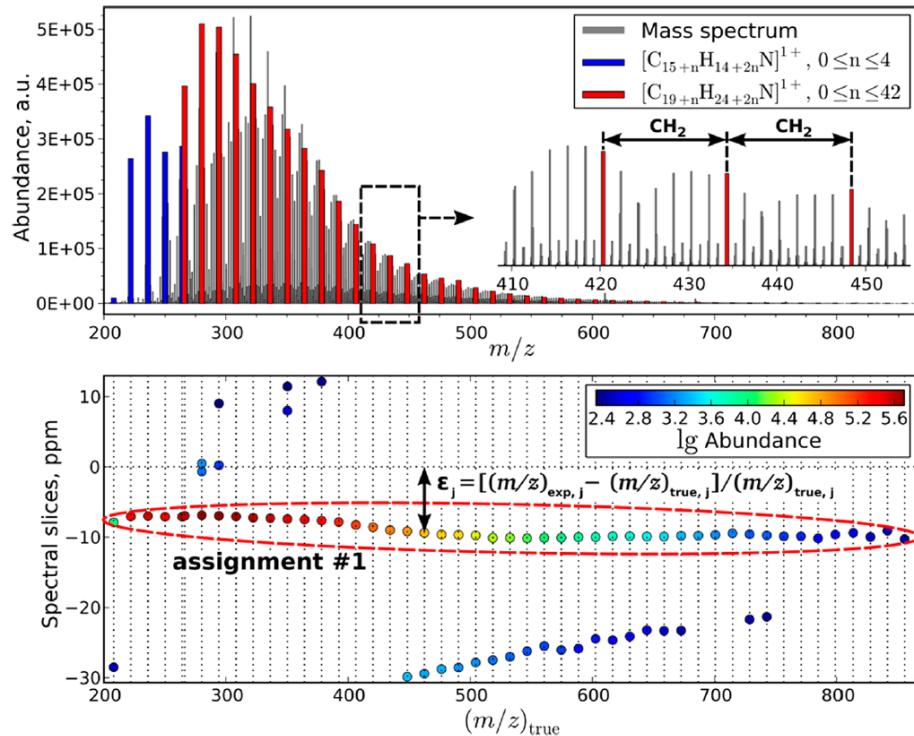

$$\varepsilon(m/z) = \sum_{j=1}^n \omega_j \varepsilon_j$$

- The estimation of the error function is done by a binomial approach
- The global mass spectrum is divided in $n - 1$ intervals (n calibrants) to define the abundance error function.
- The m/z and A (abundance) variables are splitted

$$\varepsilon_j((m/z); A) = \varepsilon_j(m/z) + \varepsilon_j(A)$$

Kozhinov, Zhurov, Tsybin *Anal Chem* 2013; 85: 6037-6445.

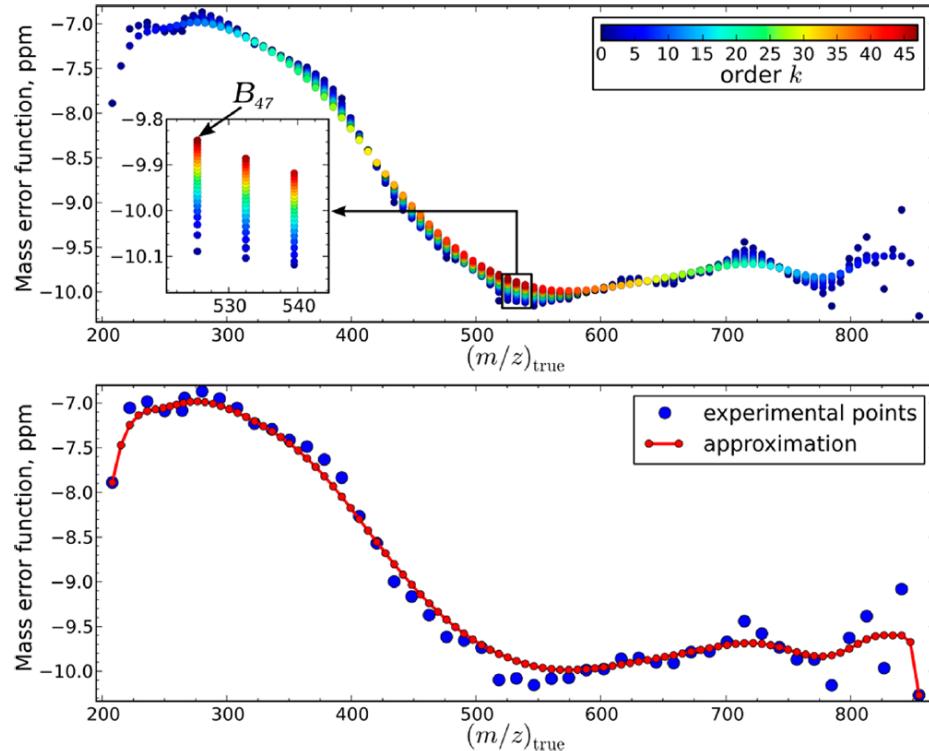

The accuracy m/z measurement – Recalibration

48 calibrants
208,1 < m/z < 854,8

Kozhinov, Zhurov, Tsybin *Anal Chem* 2013; 85: 6037-6445.

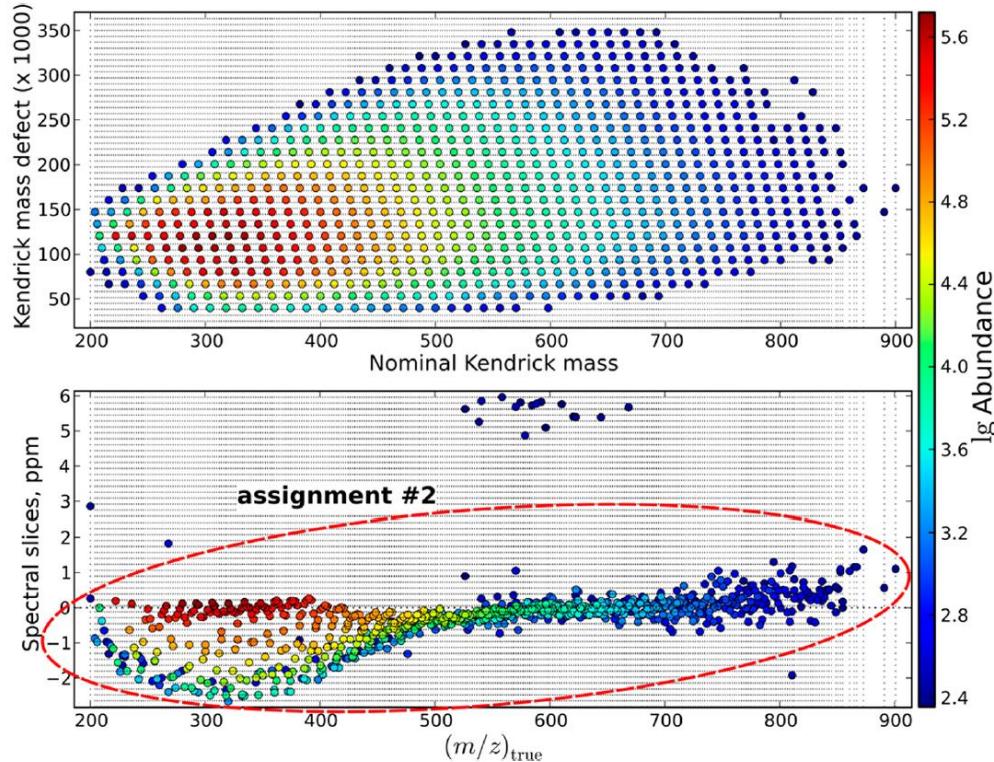

The accuracy m/z measurement – Recalibration

Determination of
 $\varepsilon(m/z)$

Kozhinov, Zhurov, Tsybin *Anal Chem* 2013; 85: 6037-6445.

The accuracy m/z measurement – Recalibration

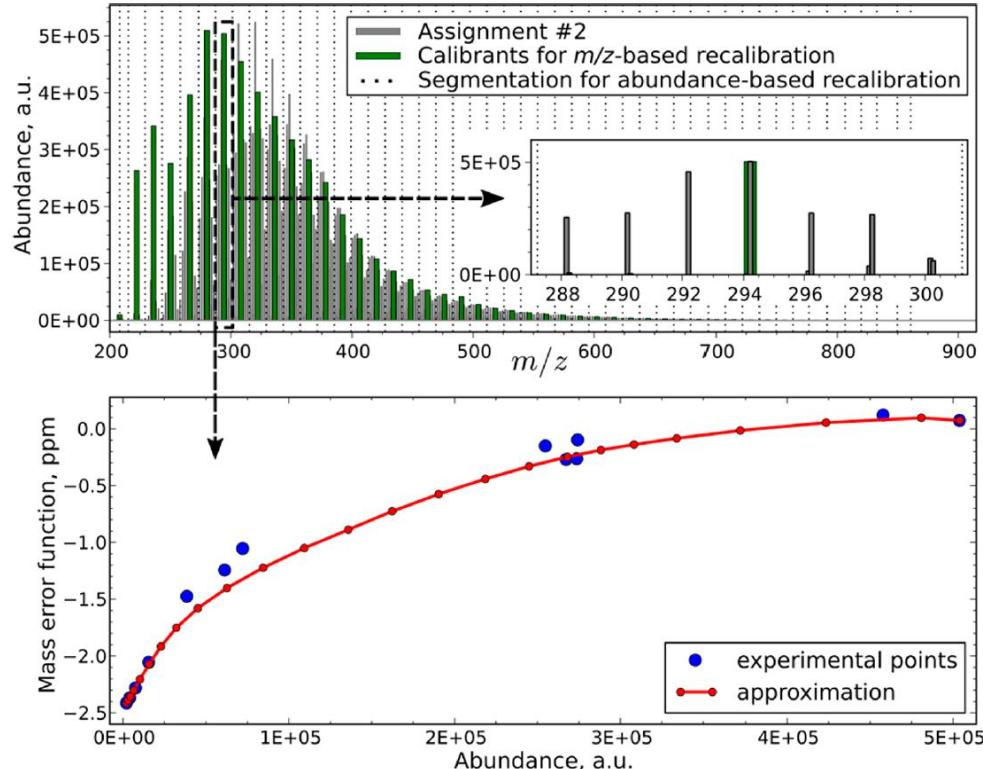

Validation by considering
the distribution of one
class of compounds (the
843 signals relative to
 C_xH_yN species)

Reassignment

Kozhinov, Zhurov, Tsybin *Anal Chem* 2013; 85: 6037-6445.

The accuracy m/z measurement – Recalibration

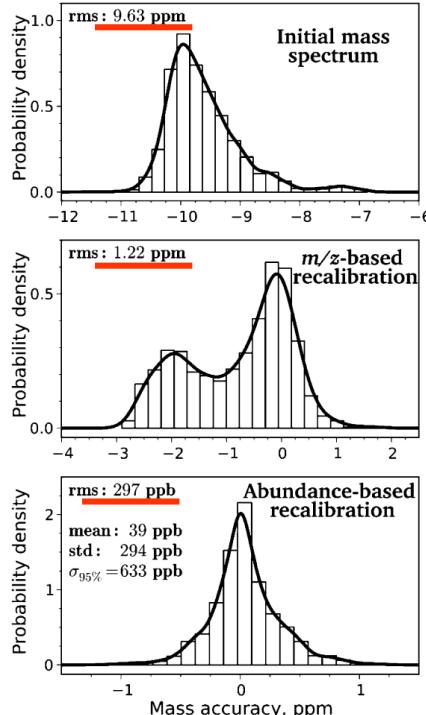

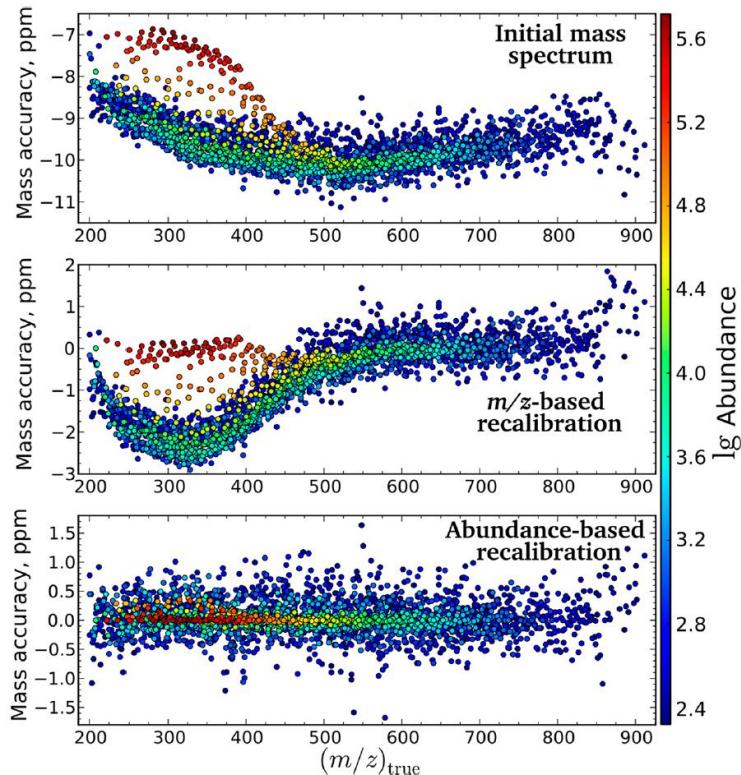

Determination of

$$\varepsilon(A)$$

Kozhinov, Zhurov, Tsybin *Anal Chem* 2013; 85: 6037-6445.

The accuracy m/z measurement – Recalibration

Kozhinov, Zhurov, Tsybin *Anal Chem* 2013; 85: 6037-6445.

Assignment

Assignment by the only use of the accurate m/z measurement

The double bond equivalent (DBE)

Determination of the number of unsaturation (double bond and ring)

$$DBE = 1 + \frac{\sum_{i=1}^{i_{\max}} N_i (V_i - 2)}{2}$$

- N_i : Number of atom i
- V_i : Valence of the atom i

For the “classical” atoms

$$DBE = 1 + \frac{1}{2} (2C + 2Si - H - F - Cl - Br - I + N + P)$$

Bivalent atoms (oxygen, ...) have no effect on the DBE value

Integer DBE value: radical ion

Kind, Fiehn *BMC Bioinformatics 2007; 8: 105.*

The six golden rules for the ion assignment

The Seven Golden Rules use heuristic rules for limiting the number of formulas only to the most probable ones

1. In respect with the measured m/z, limitation of the number of atoms for a given chemical element (databases)

Table I: Restrictions for number of elements during formula generation for small molecules based on examination of the DNP and Wiley mass spectral databases. For each element, the higher count was taken for denominating the element restriction rule #1

Mass Range [Da]	Library	C max	H max	N max	O max	P max	S max	F max	Cl max	Br max	Si max
< 500	DNP	29	72	10	18	4	7	15	8	5	8
	Wiley	39	72	20	20	9	10	16	10	4	
< 1000	DNP	66	126	25	27	6	8	16	11	8	14
	Wiley	78	126	20	27	9	14	34	12	8	
< 2000	DNP	115	236	32	63	6	8	16	11	8	15
	Wiley	156	180	20	40	9	14	48	12	10	
< 3000	DNP	162	208	48	78	6	9	16	11	8	

Kind, Fiehn *BMC Bioinformatics* 2007; 8: 105.

The six golden rules for the ion assignment

2. Respect of the Lewis rules

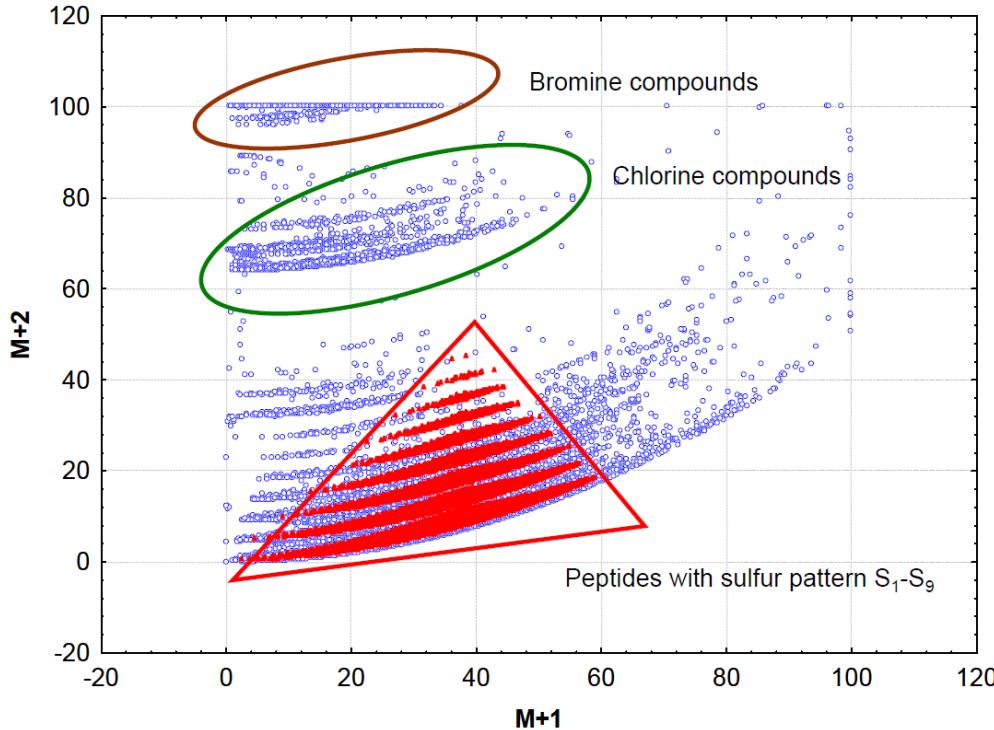

Application of the Lewis rules: valence of the atoms, bonding and non-bonding electrons pairs, octet rule, ... (the main part of the program doesn't part of these rules)

3. The isotopic distribution

The relative abundance of M+1 and M+2 contribution are useful to define the number of carbon atoms and the species including sulfur, chlorine or bromine atom

Kind, Fiehn *BMC Bioinformatics 2007; 8: 105.*

The six golden rules for the ion assignment

From the Wiley database
(45 000 compounds)

Kind, Fiehn *BMC Bioinformatics* 2007; 8: 105.

The six golden rules for the ion assignment

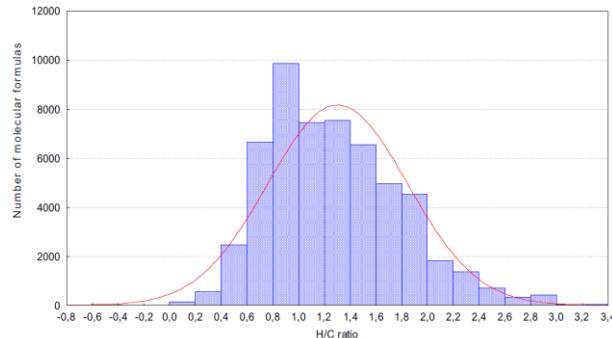

4. Hydrogen/Carbon ratio – Value of the DBE

The H/C is ranging between 0 (graphite) and 3 (cf carbone valence)

In some specific cases, it may be higher

4 : methane CH_4

6 : methylhydrazine CH_6N_2

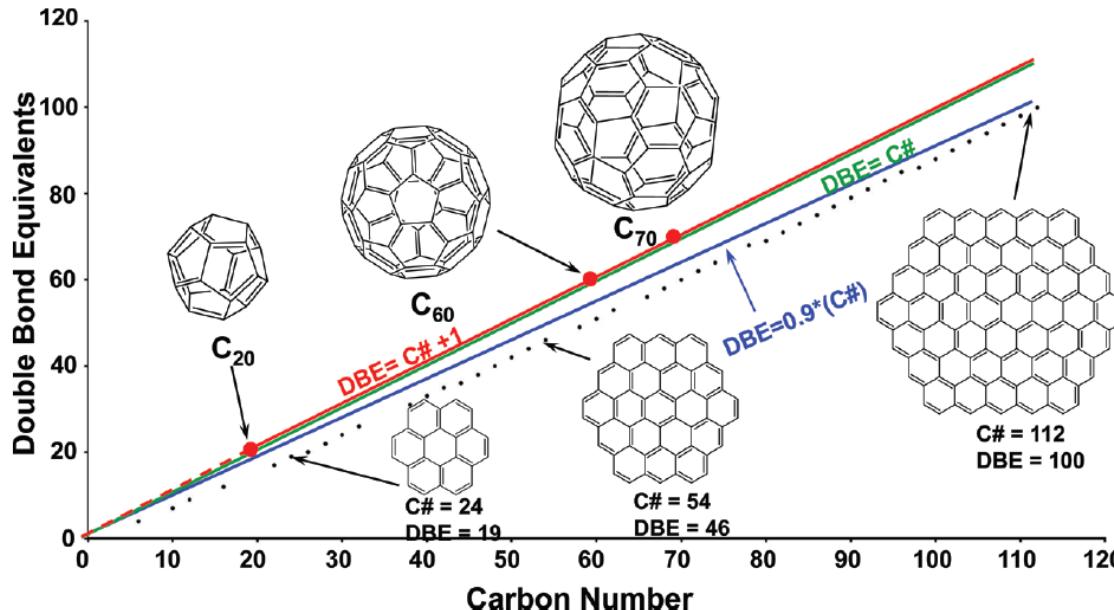

In all cases DBE of the ions ≥ 0 (exception: saturated compounds with adduit (NH_4^+ , H^+)

Kind, Fiehn *BMC Bioinformatics* 2007; 8: 105.

What about the data treatment for non-targeted analysis?

- Assign a chemical formulae to each signal (up 100,000 peaks).
- Represent the obtained features to allow comparison.

Assignment of the features

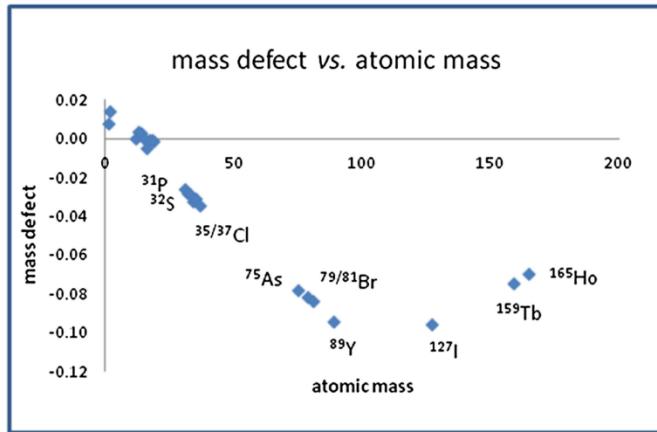

Using the six golden rules and the accurate m/z measurement the assignment of very high resolution data is possible. Nevertheless,

- The number of features is huge (thousands of peaks in petroleomic);
- For high m/z ratio, the accuracy of measurement is not enough for an unambiguous assignment;
- The resolution is not always high enough to distinguish each contribution

	0	6	12	18	34	40
C ₁₅ H ₂₇ (CH ₂) _n O ₃ S ₂ ⁺	319.14071	403.23461	487.32851	571.42241	655.51631	739.61021

The use of the Kendrick mass

The Kendrick Mass (KM)

$$KM = \text{measured mass} \times \frac{14.00000}{14.01565}$$

$14,01565 \equiv \text{mass of a } CH_2$

Other bases are possible

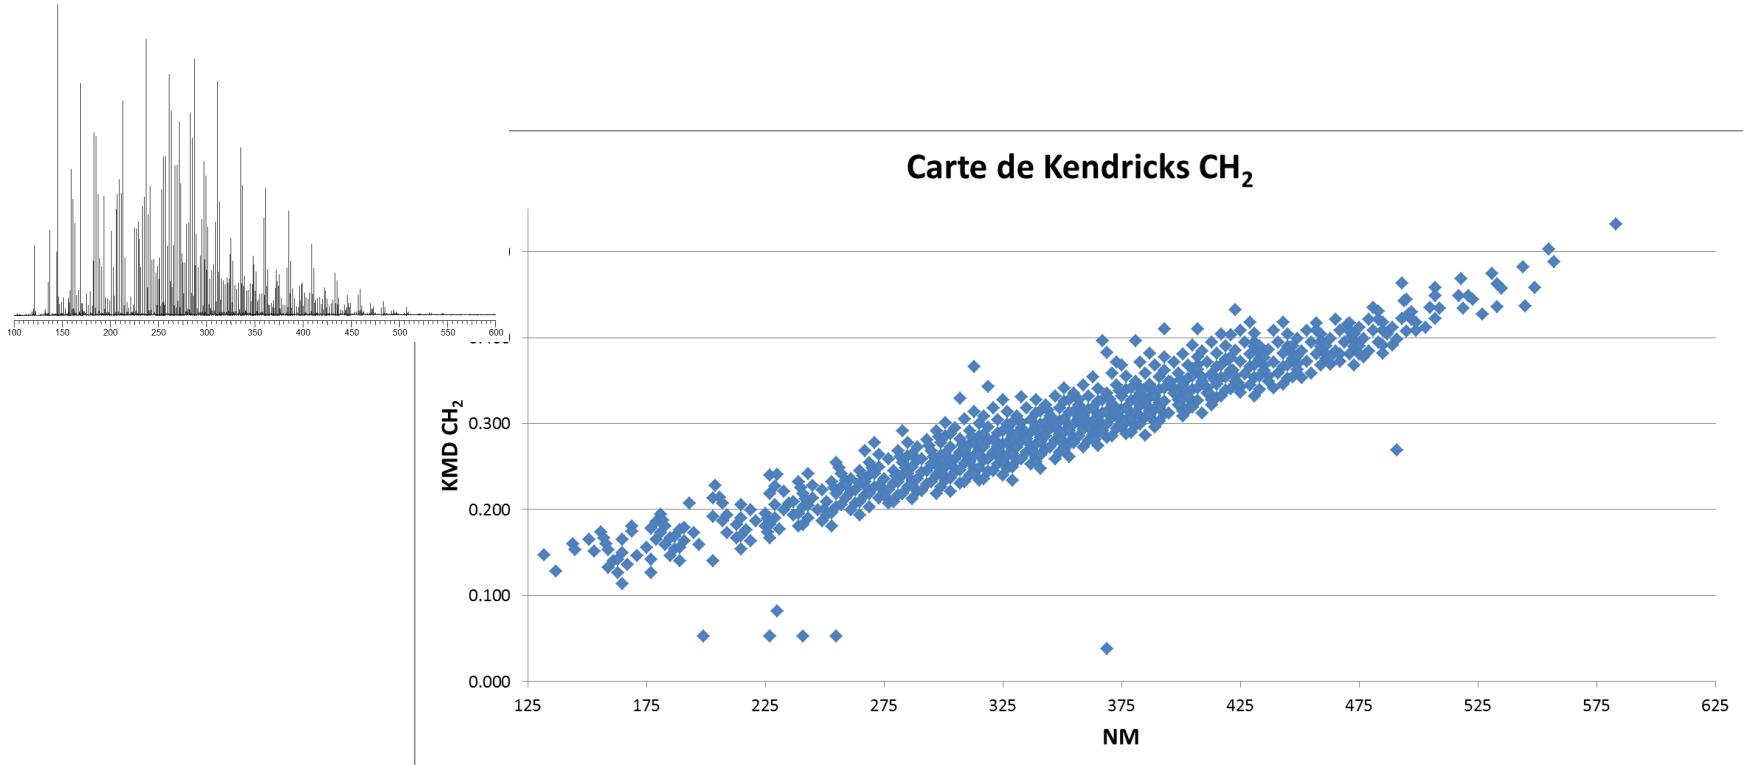

Kendrick mass defect (KMD)

$$KMD = \text{nominal mass} - KM$$

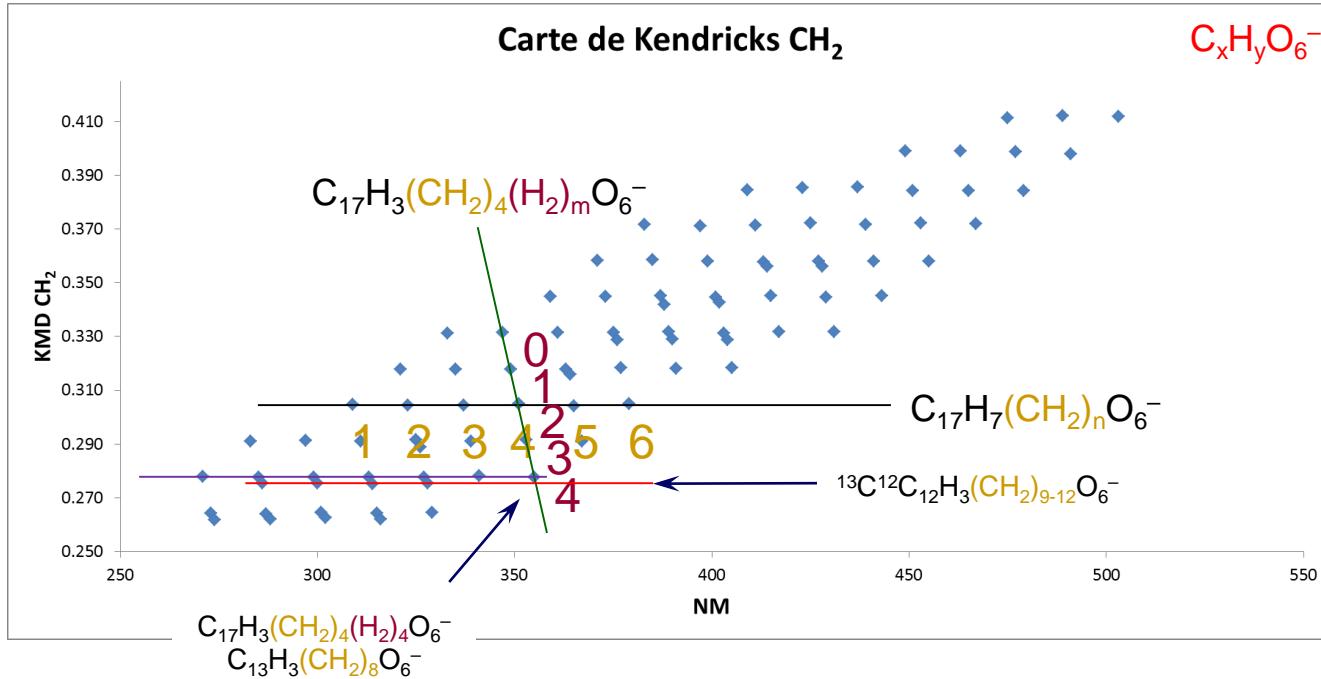

Advantages

- All the alkylated derivate of a given compound have the same KMD.
- KMD is connected to the number of unsaturation.
- The KM et KMD may be calculated with other repeat units (H_2 , O , CH_2O ,...)

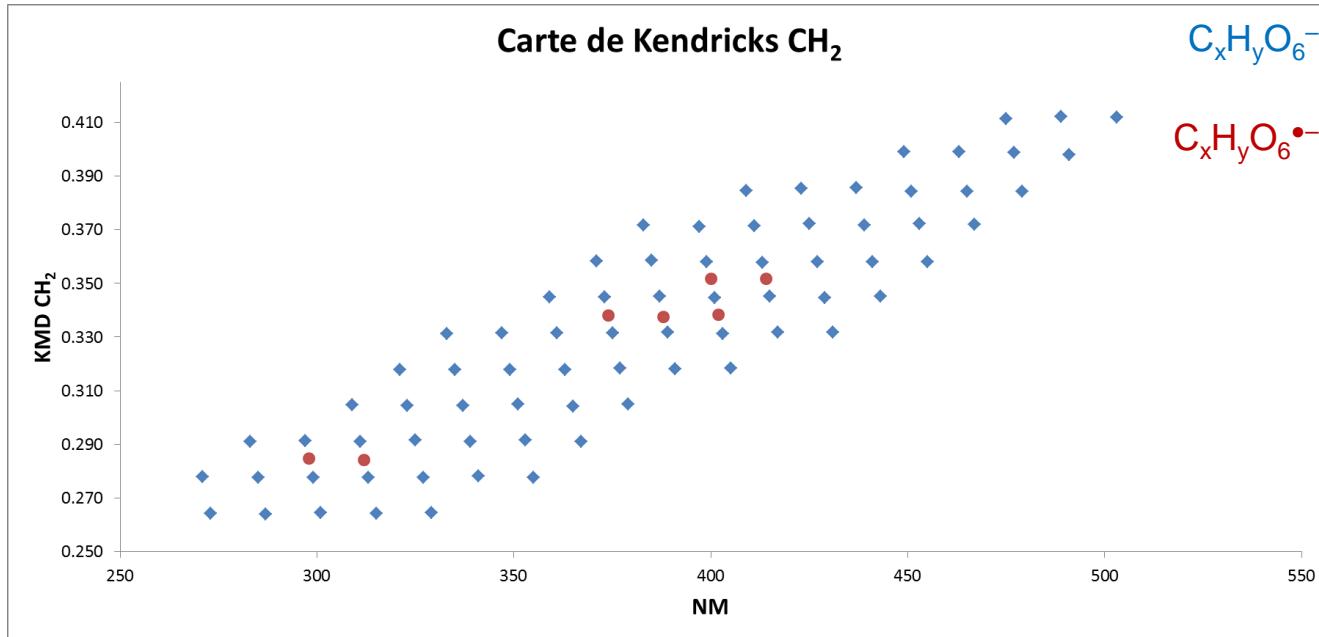

Use of the Kendrick mass

Use of the Kendrick mass

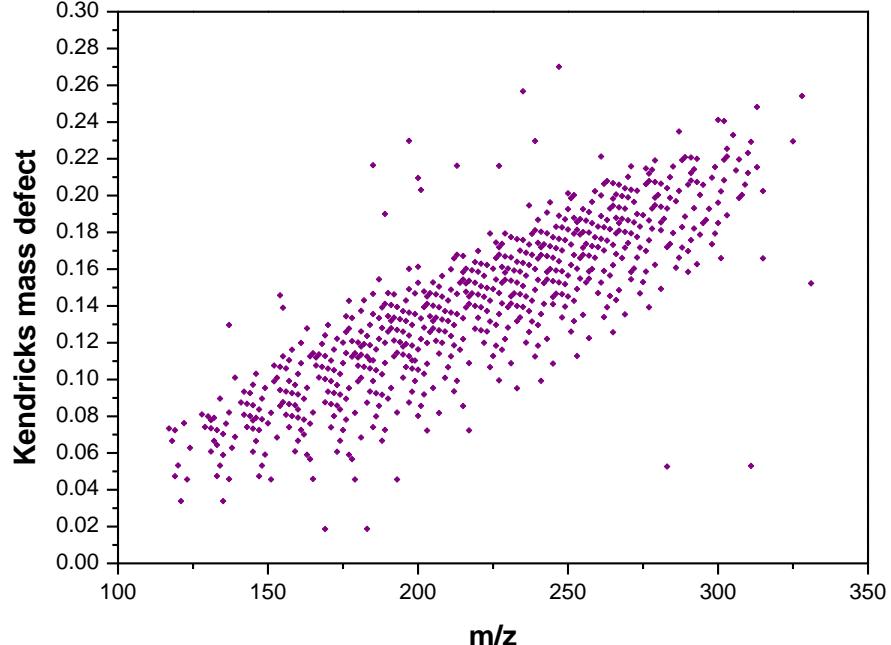

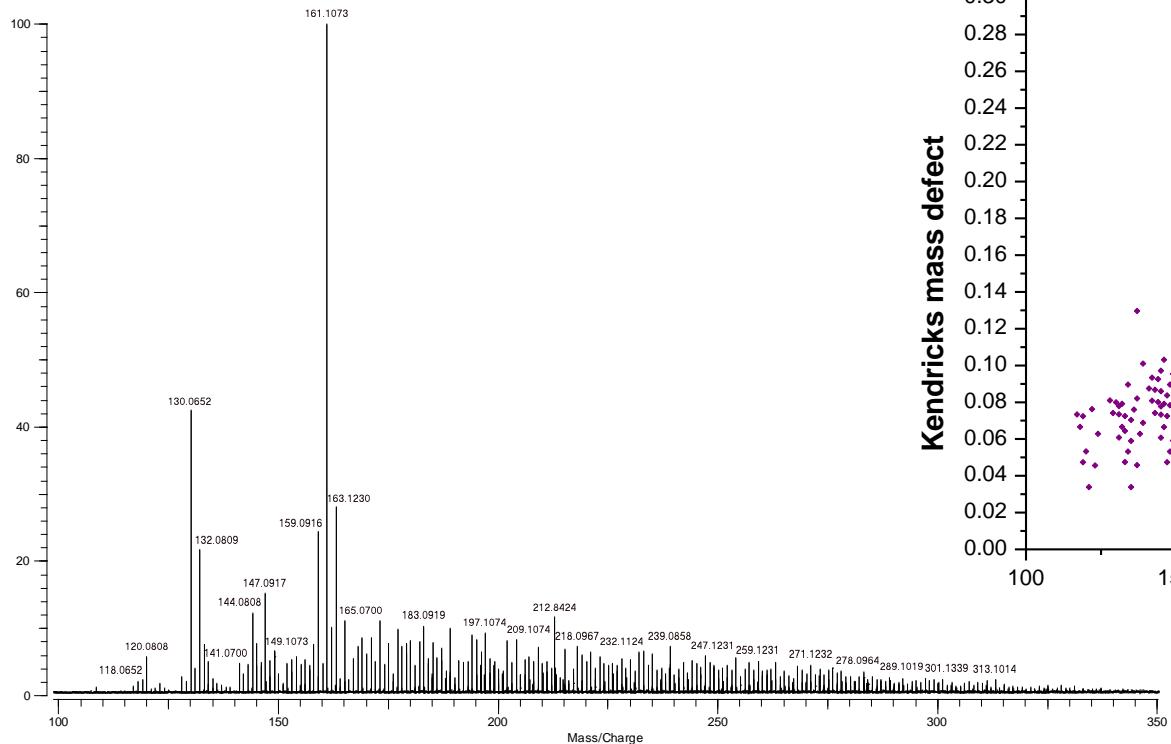

Use of the Kendrick mass

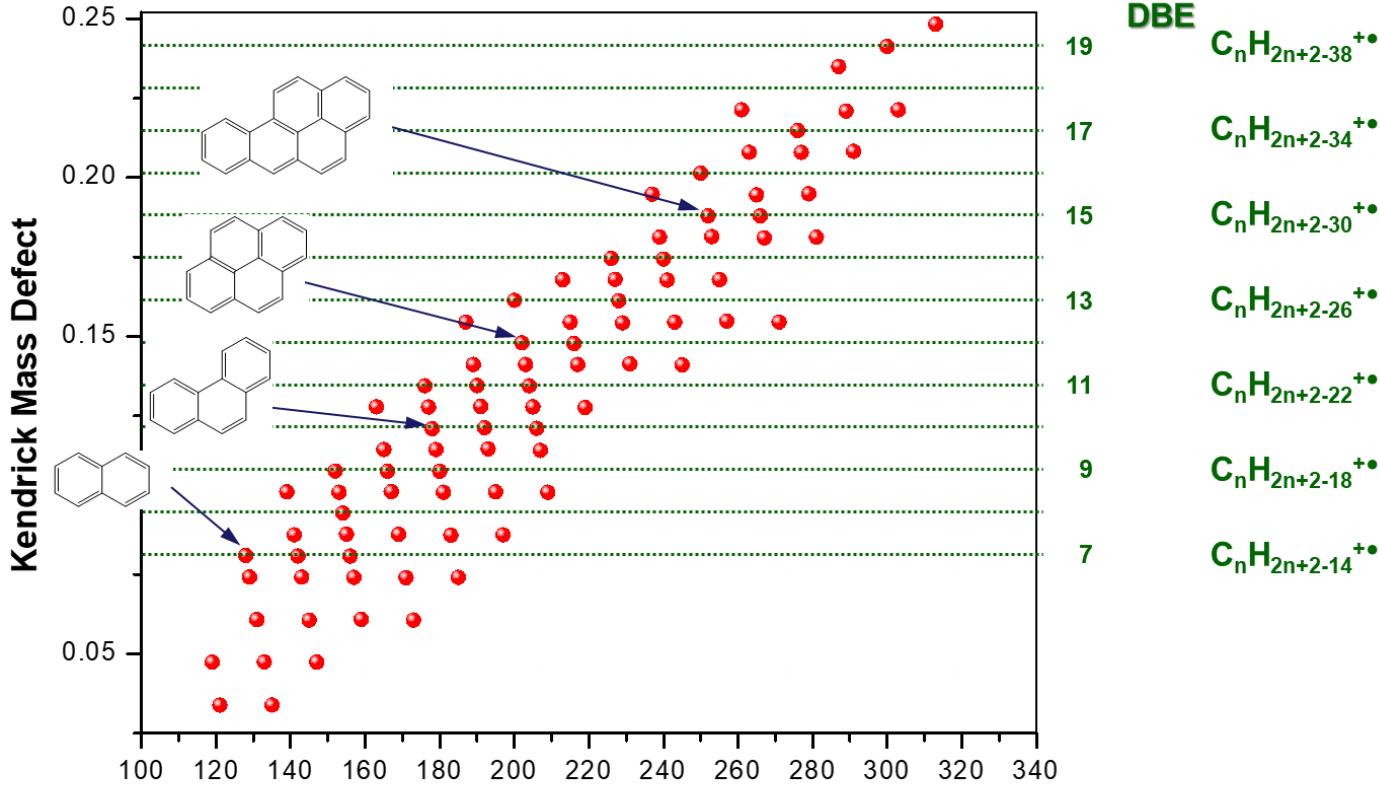

Distinguishing radical cations from cations

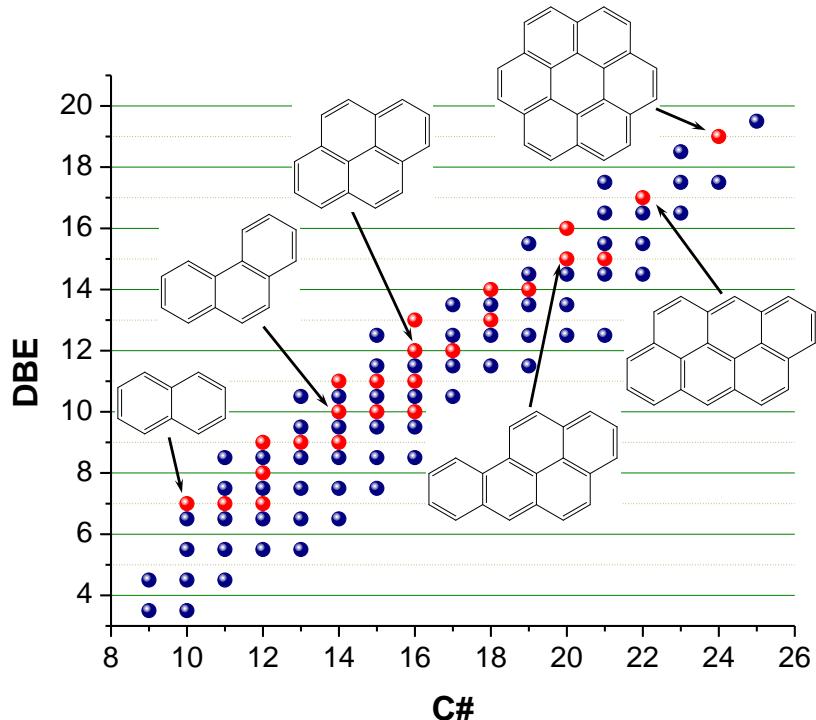

Use of the Kendrick mass

Use of the Kendrick mass

Use of the Kendrick mass

PAHs and methyl or dimethyl PAHs : $M^{+\bullet}$

Alkyl PAHs detected as $[M - H]^+$, $[M - CH_3]^+$ or $[M - C_xH_{2x+1}]^+$

Use of the Kendrick mass

The KMD(CH_2) values are tabulated

- for positive and negative ions;
- in respect with the nature and the amounts of heteroatoms;
- the $-z$ value defines the unsaturation level:

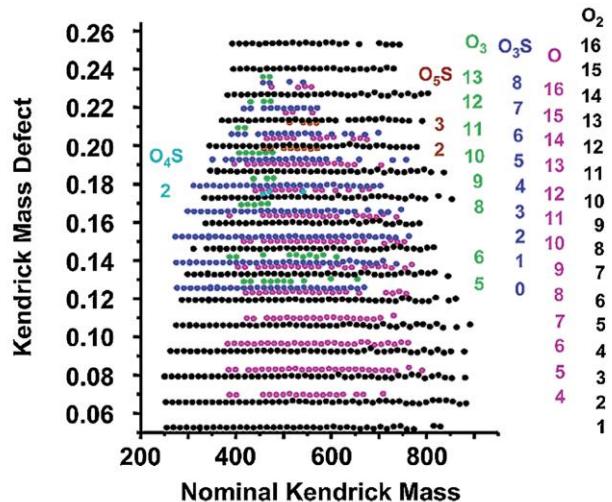

- the -1 serie is $\text{C}_n\text{H}_{2n-1}^-$
- the -2O serie is $\text{C}_n\text{H}_{2n-2}\text{O}^{\bullet-}$
- the -1O_2 serie is $\text{C}_n\text{H}_{2n-2}\text{O}_2^-$

Use of Kendrick mass for data assignment

Stepwise analysis – Principle of the main used search algorithms

From the Kendrick mass to the David mass

In complex a mixture, lot of its components are “correlated”: their chemical formulae only differ by one or a group of few atoms (on the mass spectrum: a given mass increment)

Principle

- increments which have to be searched
 - $14.01465 \equiv \text{CH}_2$
 - $1.00335 \equiv {}^{12}\text{C} - {}^{13}\text{C}$ difference
 - $1.00335/n \equiv {}^{12}\text{C} - {}^{13}\text{C}$ difference (multicharged ion)
 - $30.01056 \equiv \text{OCH}_2$
 - ...
- define the error, which has to be taken into account

Grinhut *et al.* RCM 2010; 24: 2831-2837.

Mono-charged ions
di-charged ions

Grinhut et al. RCM 2010; 24: 2831-2837.

From the Kendrick mass to the David mass

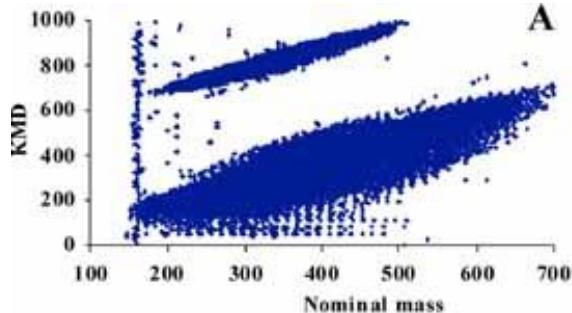

Grinhut et al. RCM 2010; 24: 2831-2837.

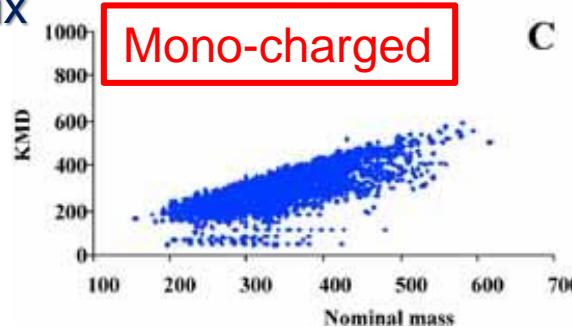

Application to the NOM analysis

15 420 signaux

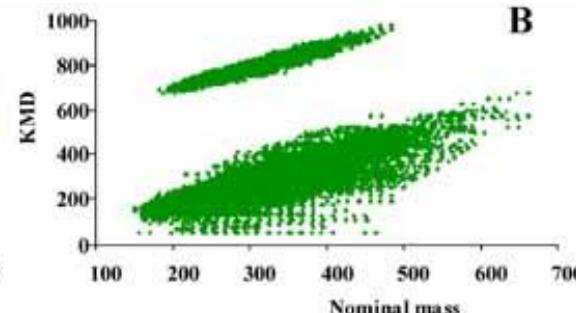

Kendrick map

2 446 signaux

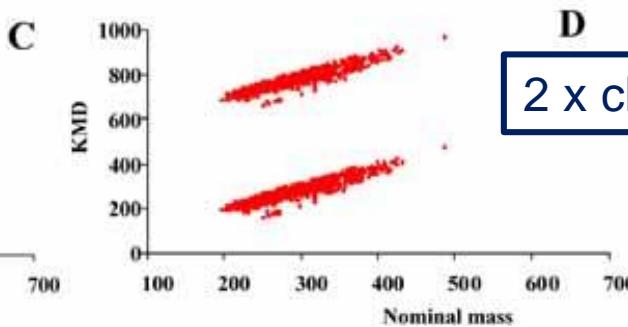

CH₂ increment

1 065 signaux

2 x charged

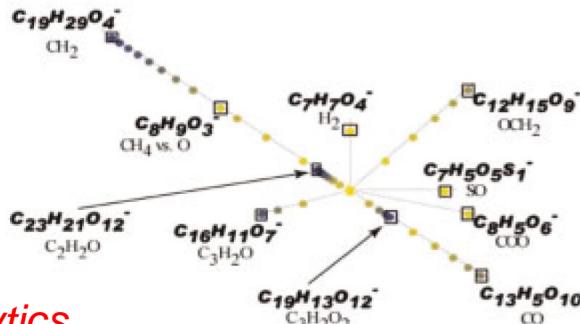

Application to the NOM analysis

Identification of only 10 repetitive units

- CH_2 , OCH_2 , CO, H_2 , COO , H_2O , O_2 , NH_3
- CH_4/O
- $\text{O}_2 - \text{CH}_4$

Use of a network based on the difference of mass for the assignment

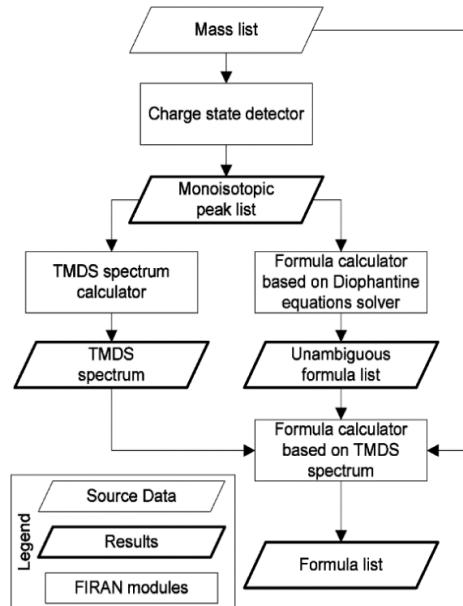

Logiciel Composer Sierra Analytics

Grinhut et al. RCM 2010; 24: 2831-2837.

The without a priori approach

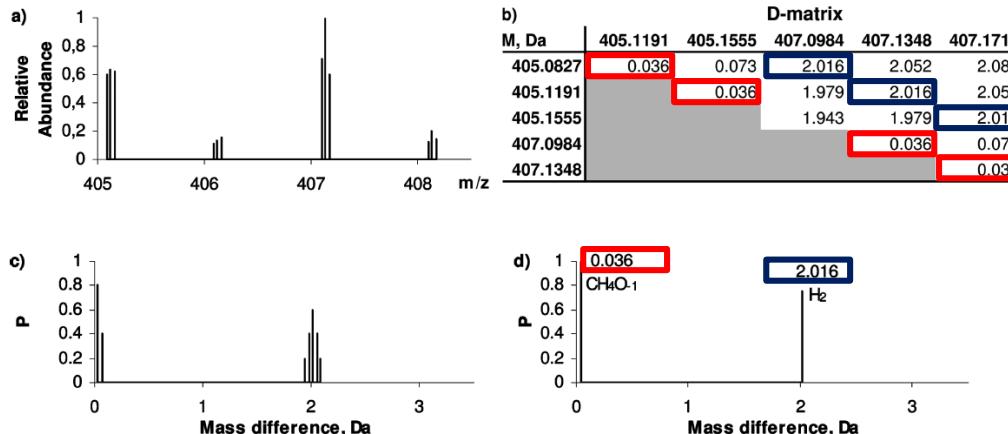

Same approach than David mass approach but without the preliminary definition of units

- Determination of the ion charge (m/z difference of $1.00335/n$)
- Mono-isotopic peak list
- Generation of a matrix corresponding to the mass difference between each feature of the peak list
- Determination of the probability for each observed difference of mass
- TMDS spectrum (total mass difference statistics)
- Use of a cutoff for the low statistic

Kunenkov *et al.* Anal Chem 2009; 81: 10106-10115.

The without *a priori* approach

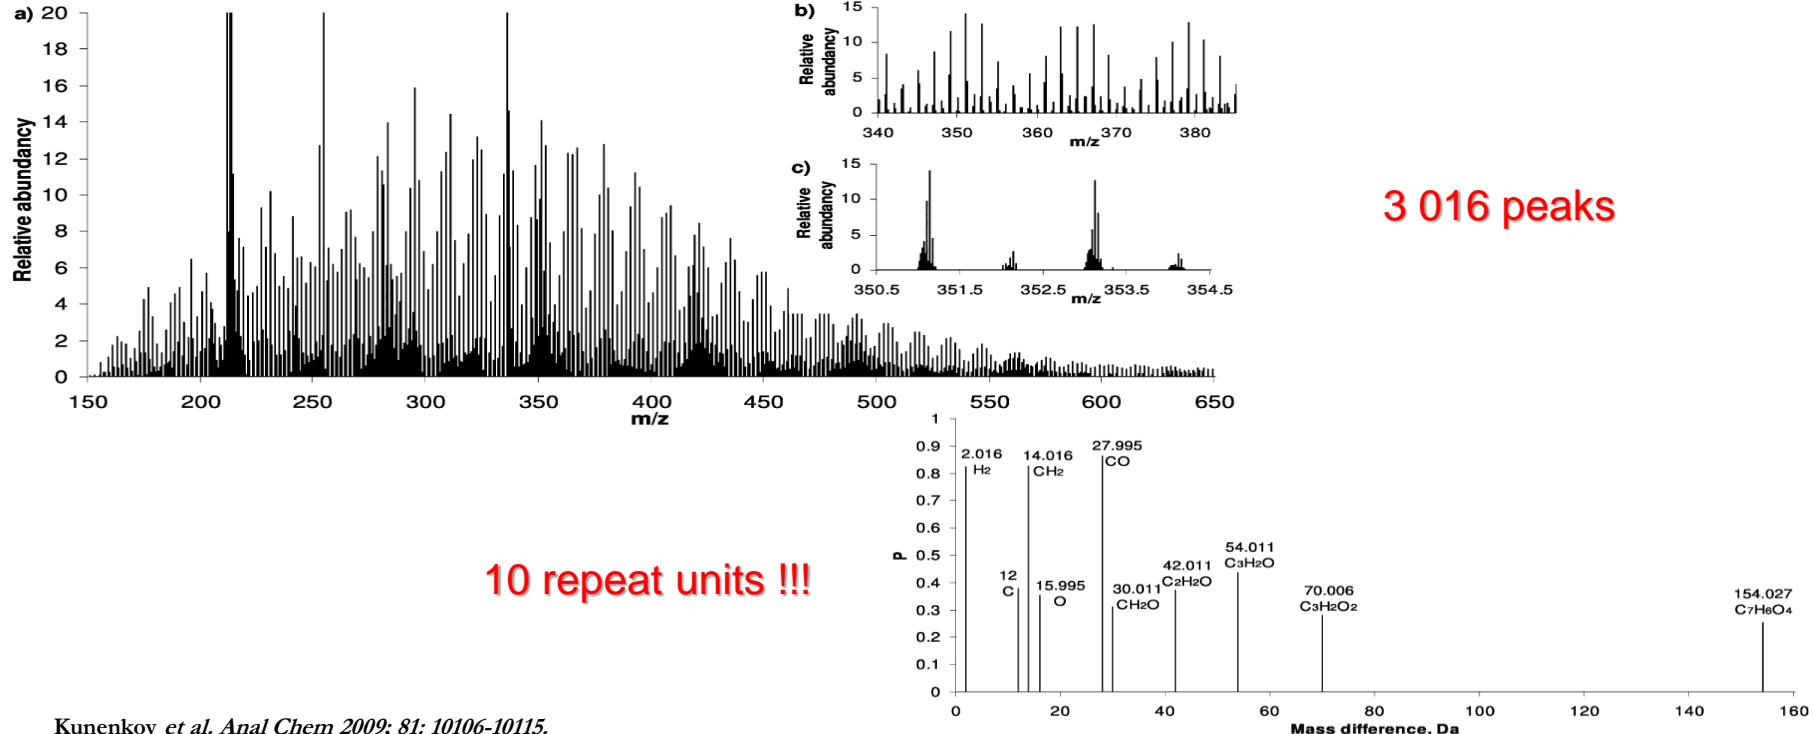

Stepwise assignment on the basis of the observed mass differences

- Increment of 2.016: addition of two hydrogen atoms
- Increment de 0.036: oxygen atom – CH₄ switching

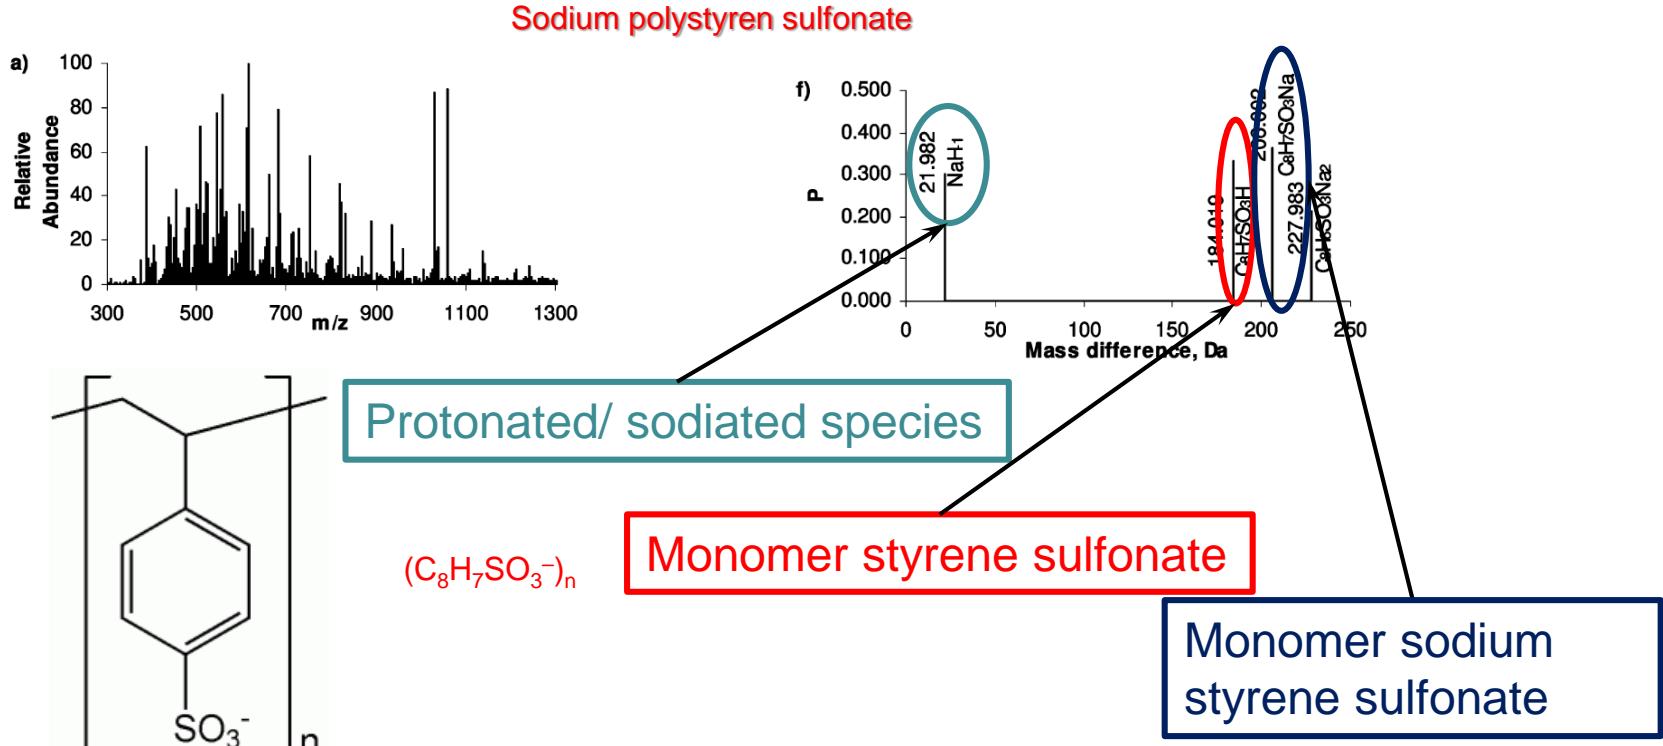

Kunenkov *et al.* Anal Chem 2009; 81: 10106-10115.

The without *a priori* approach

Kunenkov *et al.* Anal Chem 2009; 81: 10106-10115.

The without *a priori* approach

Use of second and third KMD orders

CH_2 first order mass defect

$$KM = \text{measured mass} \times \frac{14.00000}{14.01565} \quad KMD(\text{CH}_2) = \text{nominal mass} - KM$$

- We will consider $\text{C}_{12+n}\text{H}_{26+2n-2z}$ ($n = 0 - 10$ et $z = 1 - 5$)
- It is preferable to take

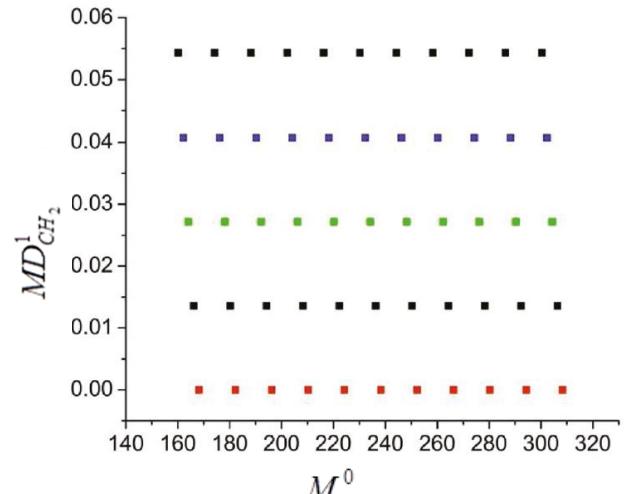

$$M_{\text{CH}_2}^1(\text{ion}) = \frac{\text{arrondi}(M_{\text{CH}_2}^0(\text{CH}_2))}{M_{\text{CH}_2}^0(\text{CH}_2)} \times M^0(\text{ion})$$

- For compounds with a positive KMD

$$MD_{\text{CH}_2}^1 = M_{\text{CH}_2}^1 - \text{Plafond}(M_{\text{CH}_2}^1, I)$$

- For compounds with a negative KMD

$$MD_{\text{CH}_2}^1 = \text{Plafond}(M_{\text{CH}_2}^1, I) - M_{\text{CH}_2}^1$$

Roach *et al.* Anal Chem 2011; 83: 4924-4929.

Use of second and third KMD orders

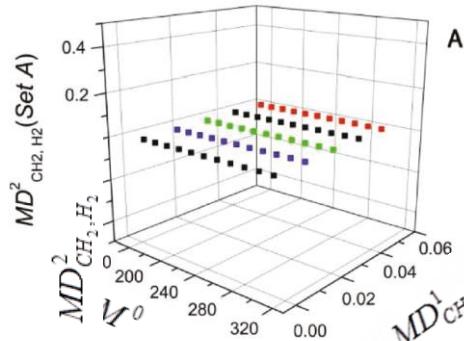

Second order H₂ / O mass defect calculation

$$M_{CH_2,H_2}^2(\text{ion}) = \frac{MD_{CH_2}^1(\text{ion})}{MD_{CH_2}^1(H_2)}$$

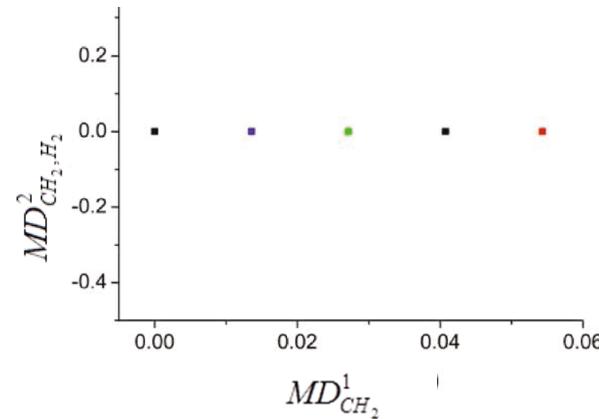

$$MD_{CH_2,H_2}^2(\text{ion}) = \text{Plafond}(M_{CH_2,H_2}^2(\text{ion}), 1) - M_{CH_2,H_2}^2(\text{ion})$$

$$M_{CH_2,O}^2(\text{ion}) = \frac{MD_{CH_2}^1(\text{ion})}{MD_{CH_2}^1(O)}$$

$$MD_{CH_2,O}^2(\text{ion}) = \text{Plafond}(M_{CH_2,O}^2(\text{ion}), 1) - M_{CH_2,O}^2(\text{ion})$$

A

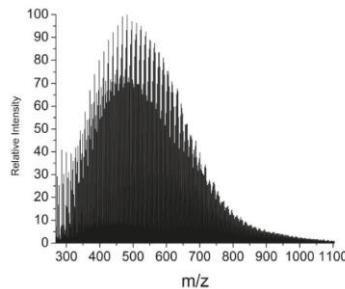

Roach *et al.* Anal Chem 2011; 83: 4924-4929.

Use of second and third KMD orders

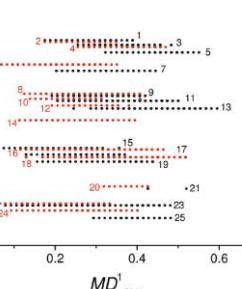

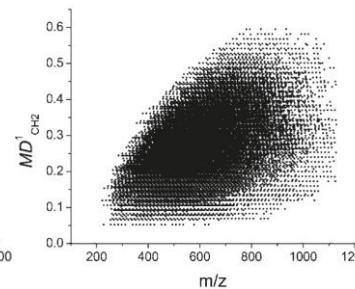

Third order mass defect O / H₂

- ① $MD_{CH_2,H_2,O}^3(ion) = \text{mod}[MD_{CH_2,H_2}^2(ion), MD_{CH_2,H_2}^2(O)]$
- ② $MD_{CH_2,O,H_2}^3(ion) = \text{mod}[MD_{CH_2,O}^2(ion), MD_{CH_2,O}^2(H_2)]$

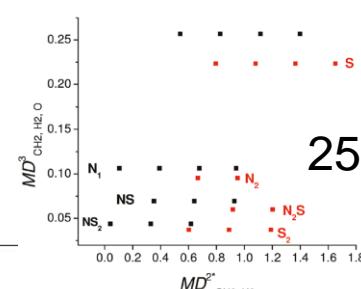

Be careful about the aliased points especially for ①, mass defects are ranging from 0 to 1 according the used formulae, they have to be corrected by 1, 2, ... to avoid aliasation
